ABSTRACT:

Here the networks oriented with respect to the wireless ad hoc based phenomena related to the multi hop oriented strategy of a routing of the opportunistic adaptive distributed scenario existing in the system based aspect in a well oriented aspect respectively. In this paper a new technique is proposed based on the well efficient phenomena of the learning of the reinforcement utilization phenomena plays a crucial role in its implementation aspect with respect to the routing of the opportunistic framework related to the well effective transmission of the packets takes place in the system reliable knowledge oriented absence takes place in the system by the statistics of the channel and the model oriented with the network based strategy plays a crucial role in its implementation respectively. Here in the present method there is an addressing of the joint well efficient strategy in which it is oriented with respect to the analysis of the joint scheme of the routing strategy in a well effective manner followed by the context of the opportunistic routing oriented phenomena takes place in the system in a well efficient manner where there is a relative routing oriented strategy in a well oriented fashion by the help of the learning of the issues of the above joint phenomena in a well oriented aspect respectively. Here the characterization of the structure oriented with respect to the well known strategy of the implementation of the network plays a major role in its aspect in a well oriented fashion by the help of the characteristics of the

of the structure oriented with respect to the well known strategy of the implementation of the network plays a major role in its aspect in a well oriented fashion by the help of the characteristics of the probabilities related to the success of the transmission in a well efficient fashion respectively. Simulations have been conducted on the present method and lot of analysis takes place on the large number of the data sets in a well oriented fashion where there is an accurate analysis takes place in the system with respect to the improvement in the performance followed by the outcome of the entire system in a oriented fashion respectively.

Keywords: Networks of the Ad Hoc phenomena, Wireless communication, Scheme of routing strategy, Reinforcement learning, routing opportunistic scenario respectively.

1. INTRODUCTION:

Here in the strategy of the wireless based phenomena it is oriented with a well stipulated fashion by which it is related to the well efficient analysis of the system oriented with respect to the routing analysis of the ad hoc related multi hoping phenomena in a well oriented fashion respectively [1][2]. Here the implementation of the system takes place in a well explicit manner where it completely overcome the problems of the routing of the conventional deficiency in a well stipulated fashion with respect to the well effective analysis takes place in the system related to the setting of the wireless application respectively. Internet oriented solutions of the routing strategies in which related to the well

efficient analysis of the system point of view by the classical motivation followed by the well accurate analysis of the system with respect to the attempts of the conventional routing oriented strategy in a well effective manner respectively [3][4]. Here the scheme oriented with respect to the strategy of the path related to the fixed phenomena plays a crucial role in its analysis point scenario respectively.

BLOCK DIAGRAM

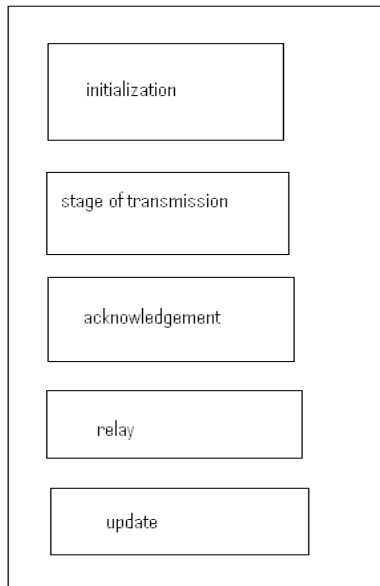

Fig 1: Shows the block diagram of the present method respectively

2. METHODOLOGY

In this paper a method is designed with an efficient framework based strategy in which it is a powerful method for the effective implementation of the system in a well oriented aspect [5][6]. Here the implementation of the present method is shown in the below figure in the form of the block diagram and explains in elaborative fashion. There is a huge challenge for the present method in which it is mainly used for the accurate analysis of the system based aspect followed by the improvement in the degraded performance due to the previous

methods and there is an effective analysis takes place in the system [7][8]. Here we finally conclude that the present method is effective and efficient in terms of the performance based strategy followed by the accurate analysis in a well oriented fashion [9].

3. EXPECTED RESULTS

A lot of analysis is made on the present method and a tremendous computations have been applied on the large number of the data set in a well oriented fashion respectively. A comparative analysis is made between the present method to that of the previous methods are shown in the below figure in the form of the graphical representation respectively. Here the present method completely overcome the drawback of the several previous methods in a well oriented fashion respectively. Here the present method is effective and efficient in terms of the accuracy followed by the aspect of the outcome and the performance in a well integrated phenomena. There is a huge challenge for the present method in which it is supposed to control the degraded performance of the previous methods and also the accurate analysis of the entire

system based outcome in a well oriented fashion.

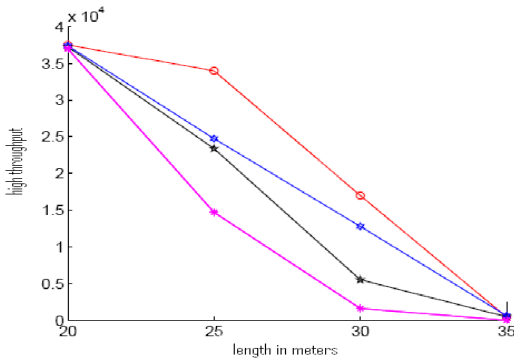

Fig 2: Shows the graphical representation of the present method respectively

4. CONCLUSION

In this paper a method is designed with a well efficient framework oriented strategy in which there is a lot of analysis takes place in the system with respect to the improvement in the performance followed by the outcome in a well oriented fashion respectively. A new technique is proposed d- adaptor strategy in a well oriented fashion where the scheme is oriented with respect to the routing of the adaptive strategy where there is a reward packet of an average strategy of the maximization in the well expected phenomena takes place in the system that is from the transmitter to the receiver in the knowledge oriented absence of the scenario in a well efficient fashion by

the help of the topology of the network followed by the quality of the link in a well oriented fashion respectively. Here the technique is well oriented with respect to the d Adaptor phenomena takes place in the system in a well effective manner by the help of the distributed fashion oriented implementation in a well effective manner takes place in the system by the performance of the provable optimal phenomena assumption of the localized strategy reliable network of the stationary acknowledge scheme takes place in the system in a well efficient manner.
