ABSTRACT:

Here an employment of the routing scheme based on the opportunistic adaptive distribution plays a crucial role in a well efficient manner for the network based strategy in the ad hoc and the wireless scenario respectively. Here the implementation of the present system based routing scheme plays a crucial role where there is a design oriented strategy of the effective framework which includes the learning of the reinforcement aspect in a well oriented fashion where there is a proper phenomena of the opportunistic strategy of the packet based routing plays a well effective role in its analysis and the dependent knowledge of the channel based behavior plays a crucial role for the proper justification of the knowledge of the channel and the proper design oriented model of the network in a well efficient manner respectively. In the analysis point of view there is a routing strategy is optimal in terms of the statistical behavior followed by the well effective criteria of the reward plays a crucial role of the transmission of the data in terms of the packet respectively. Experiments have been conducted on the present method where there is a lot of analysis takes place and the test bed is conducted on the huge number of the datasets with respect to the different environmental conditions in a well oriented fashion respectively. Here there is an accurate analysis takes place in the system in terms of the improvement in the performance followed by the outcome of the entire system in a well oriented fashion respectively.

Keywords: *Network of wireless ad hoc strategy, Scheme of opportunistic routing, Maximization reward, Routing based context strategy, Scheme of stochastic process respectively.*

1. INTRODUCTION:

There is a lot of advancement takes place in the system in the well effective routing strategy of the wireless ad hoc network respectively [1][2]. There is a huge research takes place in the system for the routing oriented concepts plays a crucial role in terms of the major phenomena based scenario under the settings of the wireless environment respectively [7][8]. Here in the data transfer followed by the well known aspect internet plays a crucial role in the data transmission in a reliable fashion. Here in the present system oriented analysis point of view routing aspect plays a crucial role under the path of the fixed environment of the data forwarding plays a major role in its analysis respectively.

BLOCK DIAGRAM

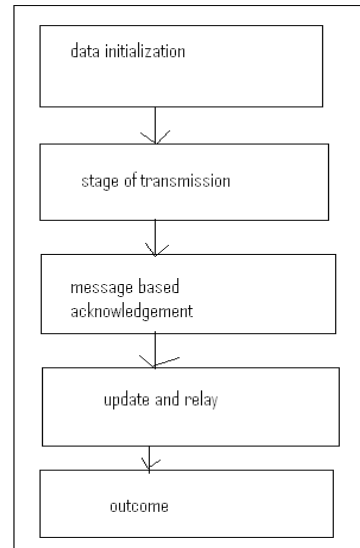

Fig1: shows the block diagram of the present method respectively

2. METHODOLOGY:

In this paper a technique is designed with a well efficient framework oriented strategy in which a number of analysis is made on the large number of the data sets followed by the different types of the environment in a well oriented fashion respectively [3][4]. Here the implementation of the present method is shown in the above figure in the form of the block diagram and is explained in the elaborative fashion

respectively [5][6]. There is a huge challenge for the present method in which the present method is accurately analyze the problems of the several previous methods followed by the improvement in the degradation based aspect with respect to the performance based strategy in a well oriented fashion respectively [9][10]. Here we finally conclude that the present method is effective and efficient in terms of the performance based strategy followed by the improvement in the system based outcome in a well oriented fashion respectively.

3. EXPECTED RESULTS:

A comparative analysis have been conducted on the present method to that of the several previous existing techniques and are shown in the below figure and in a elaborated fashion in a graphical representation respectively. Here we finally conclude that the present method is designed with an effective framework where it completely controls the degradation of the performance orient to previous techniques in an effective fashion. A lot of analysis on the present method where a large number of experiments conducted on the different number of the datasets in a quite respective fashion. Therefore the present method is

effective and efficient in terms of the performance based strategy and the results are accurate and it is efficient comparing to the methods implemented previously.

Fig2: shows the graphical representation of the present method respectively

4. CONCLUSION:

In this paper a method is designed with a well effective framework oriented strategy where there is a lot of analysis takes place where there is an improvement takes place in the system in terms of the performance followed by the outcome of the entire system in a well stipulated fashion respectively. Here in the present system based analysis point of view there is an implementation of d-AdaptOR which is one of the well effective routing scheme implemented in the present system where the reward of the packet based maximization plays a crucial role which is transmitted from the end to end in the topology of the

network by the proper maintenance of the link based quality respectively. Here in the present implemented system there is a proper distribution of the data for the improvement of the performance under the assumptions of the ideal characteristics in the reliable network of the stationary characteristics in a well oriented fashion respectively. Here we finally conclude that the present method is effective and efficient for the improvement of the system respectively. There is an investigation takes place in the system as per the present implemented strategy of the dAdaptOR for the improvement of the performance plays a crucial role in its analysis point of view respectively.
