ABSTRACT:

Here there is an introduction for the management of the privacy policy for improving the performance of the system in terms of the networks based on the social strategy respectively. For the implementation of the present designed approach there is an analysis of the feature extraction plays a crucial role by the help of the advancement in the feature extraction by the clustering based approach respectively. Then the array based operation based on the similarity of the fusion score plays a crucial role in its analysis point of view respectively. Then the approach of the management related to the policy based scenario is got introduced in a well efficient manner for the memory of the user based leverage and policies of the friends based opinion plays a crucial role in the time of the similarity of the fusing of the data takes place in the system based aspect respectively. Here this particular strategy is similar to that of the management of the policy respectively. For the well effective and the efficient demonstration of the improvement in the management of the policy based aspect is a major concern respectively. Here by the help of the above strategy there is a lot of complexity reduced in the system where there is a delay function is also taken into the consideration and got reduced in a well oriented fashion respectively. Here the above terminology is termed as the time based authorizing policy followed by the policy management is taken into the consideration respectively. Simulations have been conducted on the present method where there is a lot of analysis takes place on the large number of the data sets with respect to the relevant unknown environments in a stipulated fashion respectively. Here there is an accurate analysis takes place in the system in terms of the improvement in the

in the performance followed by the outcome of the entire system in a well oriented fashion respectively.

Keywords: *Network of social online strategy, Example of the policy, Management of the policy, Feature extraction, Clustering, Approach of management and opinion score respectively.*

1. INTRODUCTION:

Here there is a lot of advancement takes place in the system for the well effective and the efficient purpose of the feature extraction as a major strategy in the implementation followed by the analysis plays a crucial role in its implementation respectively [1][2]. Here for the present system oriented strategy there is a requirement of the function of the modularity followed by the scenario of the optimization of the networks plays a crucial role in a well oriented fashion respectively [3].

BLOCK DIAGRAM

Fig 1: Shows the block diagram of the present method respectively

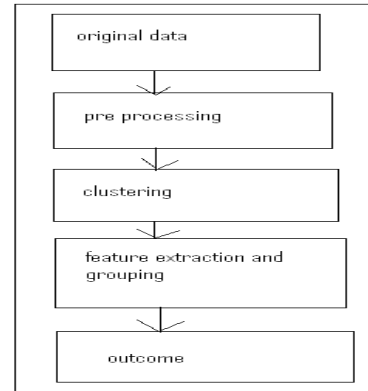

Fig 2: Shows the architecture of the present method respectively

2. METHODOLOGY

In this paper a method is designed with a well efficient framework for the effective implementation of the system in a well oriented fashion respectively [4][5]. There is a huge challenge for the present method it is supposed to accurately analyze the problems of the several previous methods and also to control the performance of the degraded strategy of the several previous methods and improve the performance of the system in a well oriented fashion respectively [6]. Here the

implementation of the present method is shown in the above figure in the form of the architectural analysis and is explained in the elaborative fashion respectively. Here the present method completely overcome the drawbacks of the several previous methods in a well oriented fashion and improve the performance of the system in a well effective manner respectively. Here we finally conclude that the present method is effective and efficient in terms of the out some of the entire system based strategy followed by the improvement in the performance in a well respective fashion respectively [7].

3. EXPECTED RESULTS

A comparative analysis have been conducted on the present method to that of the several previous existing techniques and are shown in the below figure and in a elaborated fashion in a graphical representation respectively. Here we finally conclude that the present method is designed with an effective framework where it completely controls the degradation of the performance orient to previous techniques in an effective fashion. A lot of analysis on the present method where a large number of experiments conducted on the different

number of the datasets in a quite respective fashion. Therefore the present method is effective and efficient in terms of the performance based strategy and the results are accurate and it is efficient comparing to the methods implemented previously.

4. CONCLUSION

In this paper a method is designed with a powerful technique where there is a lot of analysis takes place in the system in terms of the improvement in the performance followed by the outcome of the entire system in a well oriented fashion respectively. Here in the present system oriented strategy there is a lot of improvement in the scenario of the perceptions of the user plays a crucial role in its implementation and the following analysis point of view for the improvement in the system based aspect in a well oriented fashion respectively. Here an implementation of the approach based on the policy management plays a crucial role where there is a reduction of the time based policy followed by the integration of the approach of the management plays a crucial role in a well oriented fashion respectively. Here by the help of the present approach of the management policy in a similar fashion

for the improvement of the performance of the system in terms of the implementation where there is a reduction of the complexity and also the time based reduction and followed by the memory status respectively. Here we finally conclude that the present method is effective and efficient in terms of the improvement in the performance followed by the outcome of the entire system in a well oriented fashion respectively.
