**ABSTRACT:**

Here an approach is designed based on the efficient analysis of the system based strategy followed by the recognition of the data in an efficient manner oriented to the offline based scenario in a well effective strategy where there is an effective retrieval of the data based on the context oriented handwritten phenomena in a efficient manner where there is an accurate retrieval of the data related to the Chinese based classification oriented strategy in a well effective manner respectively. Here segmentation oriented with the integrate strategy where the framework is designed based on the effective retrieval of the data or the recognition of the data in a well oriented fashion followed by the segmentation based character strategy, And there are some of the problems with respect to this particular oriented strategy where some of them includes evaluation of the path based candidate, efficient search oriented strategy and followed by the estimation of the parameter based analysis respectively. Here the evaluation or the examination of the path oriented strategy includes the context based on the multiple strategy followed by the view of the decision based Bayesian phenomena in a well oriented fashion respectively. Where the classifiers are converted in to the probability of the posterior in a well oriented fashion respectively. Here the search based on the path oriented strategy there is a beam search oriented refinement takes place in the system in a well effective pattern where improving the system efficiency followed by the accurate outcome of the system in a well oriented fashion with respect to the accurate outcome oriented strategy respectively. Experiments are conducted on the present designed technique where its outcome is evaluated in a well oriented fashion and its performance based strategy is represented in a well efficient format respectively.

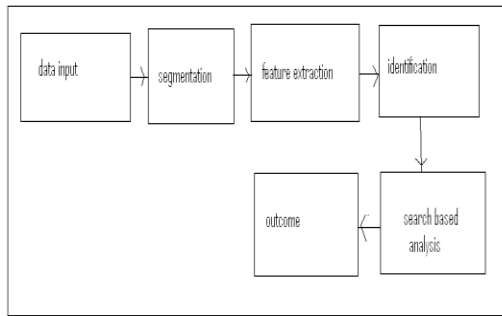

***Keywords: Recognition of the Chinese text, Transformation confidence, Models of the geometric strategy, Models of the language based analysis respectively.***

## 1. INTRODUCTION

There is a lot of advancement in the system based strategy takes place in a quite effective manner respectively. Here there is a huge challenge with respect to the extraction of the ext based strategy in a well efficient fashion respectively. Apart from this there is a huge challenge here there is a retrieval of the data in the form of the character recognition based approach in which there is accurate analysis followed by the detection of the Chinese words in a well respective fashion [1][2]. There is a huge research based aspect is going on the present system from the last decade and till now there is none of the technique is successful in terms of the implementation based strategy in a well respective fashion. There is a huge problem followed by the minute variations in the system with respect to the study of the behavioral aspects of the phenomena related to the recognition of the character followed by the recognition of the character based on the string based strategy in a well respective fashion [3]. These are above problems and till now there is no particular method which is effective implemented the analysis followed by this particular strategy in a well oriented fashion respectively. Actually the major thing this sought of technology is a failure one where there is a

huge complexity in the system takes place in a well efficient manner followed by the accuracy of the entire system is lost based on the performance oriented strategy in a well effective manner respectively. Therefore there is major concern for the present method apart from the implementation based aspect respectively [4]. As before the research has evaluated up to the mark but even not successful at that time of the implementation there is an analysis of the written text based analysis in a well respective fashion respectively. Here in this particular type of the aspect related strategy there is an effective implementation of the system is completely based on the evaluation related to the data sets oriented fashion respectively [5]. At the time of the recognition of the string based on the character oriented strategy in a well efficient manner here the extraction based strategy is completely based on the accurate detection of the text based lines followed by the phrases based strategy in which some of the applications oriented phenomena in a well respective fashion and some of them includes recognition of the checks oriented to the banks in the relativity of the legal aspects of the banks followed by the phrase of the address recognition respectively [7][8].

## BLOCK DIAGRAM

**Fig 1: Shows the block diagram of the present technique oriented presentation approach respectively**

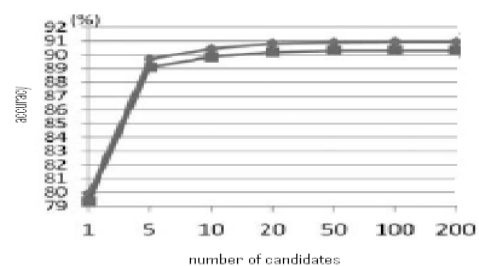

## 2. METHODOLOGY

In this paper a method is designed with a well effective strategy where there is an effective implementation of the system followed by the accurate analysis oriented strategy in a well respective fashion respectively [6]. There is a huge challenge for the present method where it completely analyzes the performance of the previous methods with respect to their problems related aspect followed by the system oriented outcome in a well efficient fashion respectively. Here the present designed method is shown in the below figure in the form of the block diagram where it is briefly shown in a elaborative fashion respectively. Here we finally conclude that the present designed method is effective and efficient in terms of the performance based strategy in a well

effective manner respectively where there is a controlled degradation of the performance based strategy followed by the accurate analysis with respect to the system outcome respectively [9][10].

## 3. EXPECTED RESULTS

A lot of analysis has been made on the present technique where the numbers of computations have been applied on the large number of the datasets in a well oriented aspect respectively. A comparative analysis is made between the present method to that of the several previous method and is shown in the below figure in the form of the graphical analysis respectively. Therefore the present system completely overcomes the drawbacks of the several previous existing methods in a well oriented fashion respectively.

**Fig 2: Shows the graphical representation of the present technique respectively**

#### 4. CONCLUSION

Here a new technique is designed based on the efficient implementation oriented strategy followed by the accurate analysis based scenario respectively. Here actually the main aspect of the following techniques is for the effective identification of the text based strategy which is written under the Chinese oriented language in a well efficient fashion in which a system is modeled by the help of the accurate segmentation of the character based strategy followed by the search based path of the candidate in the well oriented fashion respectively. Here there is an accurate extraction of the paths in related to the decision view based Bayesian strategy in a well oriented fashion followed by the context based on the multiple combination oriented strategy in a well efficient manner respectively. Where some of the strategies based on the context oriented scenario includes effective score of the classification based character and the context based on the geometric and linguistic oriented scenario respectively. Here we finally conclude that the present designed technique is effective in terms of the strategy respectively.
