ABSTRACT:

In the streaming of the video based strategy related to the network oriented aspect of the multicast phenomena in a well efficient fashion by which it is related to the aspect of the possibility of the heterogeneous based phenomena in a well efficient fashion by which bandwidth of the user based strategy in a well efficient fashion by which difference of the magnitude based fashion in which it is related to the well oriented fashion where mainly used for the condition of the addressing of the issue related to the aspect of the heterogeneous phenomena in a well efficient fashion addressing of the bandwidth plays a major role respectively. Here the encoding of the source related to the video of the phenomena takes place a major role in its implementation orientation based strategy in which encoding of the source related to the video in a well efficient manner followed by the aspect of the analysis related to the well effective phenomena take place followed by the description of the independent multiple strategy encoding of the source related to the video plays a major role respectively. Here depending on the bandwidth availability a description of the receiver based joins the requirement of the allocation of the bandwidth requirement oriented strategy in a well efficient fashion followed by the analysis of the description joins respectively. There is a huge challenge for the present method in which multicast of the video based strategy in which it is related to the phenomena of the MTC plays a major role in its implementation strategy related to the description of the bandwidth assignment plays a major role in its implementation aspect in a well oriented fashion respectively. Here a new technique is proposed based on the strategy of the well effective analysis in its implementation where there is a huge challenge in which related to the aspect of the video based strategy video of the MDC based problem analysis in a well respective fashion of the bandwidth assignment

strategy in a well effective manner respectively. Here a problem of the optimization based strategy in a well efficient manner by which it is related to the aspect of the formulated issue investigation plays a major role with objective of the bandwidth maximization oriented strategy in a well effective manner. Experiments have been conducted on the present method and a lot of analysis takes place in the system in a well efficient fashion in terms of the performance based strategy followed by the outcome of the entire system in a well effective fashion respectively.

Keywords: *Video coded multiple description strategy, Assignment of the description oriented with optimal bandwidth, Annealing simulation respectively.*

1. INTRODUCTION

Network oriented with respect to the multicast strategy in which it is related to the aspect of the streaming of the video is a primary concern in its aspect followed by the requirement of the bandwidth based user oriented strategy in a quite heterogeneous fashion where the difference of the magnitude in the possible order of the devices related to the mobile plays a major role in terms of the Mb/seconds of the high definition based strategy related to the coding of the multiple description where there is an accurate addressing of the issue related to the strategy of the bandwidth oriented phenomena plays a major role [1][7].

BLOCK DIAGRAM

Fig 1: Shows the block diagram of the present method respectively

2. METHODOLOGY

In this paper a method is designed with a well efficient framework oriented strategy in a well effective manner respectively. Here there is a huge challenge for the present method in which where it is supposed to accurately analyze the performance of the previous methods and their related problems oriented drawbacks in a well respective fashion followed by the controlled oriented

strategy of the of the degraded performance of the several; previous methods and improvement in the entire system based scenario respectively [2][3]. Here the implementation of the present method is shown below in the form of the block diagram and explains in a brief elaborative fashion respectively [4][5]. Here the present method completely overcome the drawbacks of the several previous methods and improve the performance of the system in a well efficient manner and also the improvement takes place with respect to the entire outcome based strategy respectively[6][8].

3. EXPECTED RESULTS

A comparative analysis is made between the present method to that of the several previous methods is shown in the below figure in the form of the graphical representation and explains in an elaborative fashion respectively. Here a lot of analysis is made on the present designed technique and a huge computations are applied on the large number of the data sets in a well oriented fashion with respect to the different types of the environment respectively. There is a huge challenge for the present method in which it is supposed to accurately analyze the problems of the previous methods and improve the present system oriented performance respectively.

Here the present designed method is very powerful oriented strategy in which it completely overcomes the drawbacks of the several previous methods in a well effective manner which improves the performance in a drastically oriented manner respectively.

Fig 3: Shows the graphical representation of the present method respectively

4. CONCLUSION

In this paper a method is designed with a well efficient framework oriented stage in a well effective manner in terms of the improvement in the performance based aspect followed by the outcome of the entire system by the help of the implementation of the powerful aspect in a well oriented aspect respectively. A technique is designed based on the aspect of the fourth generation based network oriented aspect in a well efficient fashion followed by the strategy in which the networks related to the wireless based phenomena in a well effective manner in the generation of the future based well efficient strategy terminal related to the

well efficient heterogeneous support oriented aspect of the proposal of the MDC based coding strategy in a well oriented fashion which is related to the description of the multiple phenomena in a usage of the terminology respectively. Here the terminal oriented various capabilities related to the descriptors in a well respective fashion reception of the usage of the description in a well respective fashion takes place in the system based aspect respectively. Terminals based on the strategy of the individual analysis on a well oriented fashion by which requirement of the unaware application respectively.
