ABSTRACT:

Here the operations related to the access of the randomized strategy in a well efficient manner by the help of the desirable streaming of the video based on demand oriented strategy by which systems based on the end to end based transmission is a major strategy respectively. Here the activity of the present scenario oriented aspect is asymmetric in its behaviour followed by the nature based on the dynamic interaction oriented phenomena in a well efficient manner where there is a somewhat difficulty in terms of the implementation based aspect related to the strategy of the end to end transmission in a well efficient fashion respectively. Here a new technique is proposed based on the phenomena of the distribution of the content in a well effective manner followed by the aspect of the followed by the equivalent coding based on the network strategy in a well efficient fashion depending on the demand of the user is a primary concern. Here in the present scenario where there is an accurate classification based strategy in which segmentation or the well partitioning of the video based strategy in a well stipulated fashion into the small blocks based phenomena in a well efficient manner and also the implementation based aspect takes place where there is a distribution of the encoding based phenomena in a well efficient fashion from the end to end basis respectively. At the time of the operations based on the randomized strategy in which where the accessing of the video for the new customer in the form of the new nodal system there is a huge analysis takes place in the system based aspect in which there it must connect to the parent based phenomena in a well efficient manner followed

by the reliable transfer of the data followed by the less consumed power oriented aspect in a respective fashion takes place in the system. For this purpose a new technique is proposed by which it is supposed to improve problem based strategy in a well oriented fashion respectively. Experiments have been conducted on the present method and the accurate analysis is made with respect to the entire system based outcome in a well respective fashion by which in terms of the performance based strategy respectively.

Keywords: Data deletion assured file based policy, Storage of the cloud based aspect, Implementation of the prototype in a well efficient fashion.

1. INTRODUCTION:

In this aspect storage of the cloud based strategy plays an efficient role for the implementation of the system is a major concern based aspect respectively. Here the data of the user is completely stored in the cloud oriented third party as a major concern [1]. As before it is somewhat different in its implementation based aspect there is an advancement in the scenario by which there is an effective implementation of the system which there is an unlimited resource allocation as a major strategy in the system based analysis oriented aspect respectively. Here the data of the user is got completely stored in the third party based strategy in a well oriented fashion by which there is an storage based scenario followed by the privacy is a major concern related aspect. Here the data provision takes place by the mutual agreement based strategy in which how much time followed by the rate of the bandwidth followed by the factor dependent on the cost factor plays a major role in the system based aspect [3][4]. Here the system of the provision of the service classified based on the private followed by the public based strategy where the cost for the private based aspect is more on comparison to the public [2][5]. Here the amount for the private is more that is used for the commercial based aspect where as the public used for the free user oriented aspect which is used for the user basis in a well respective fashion.

BLOCK DIAGRAM

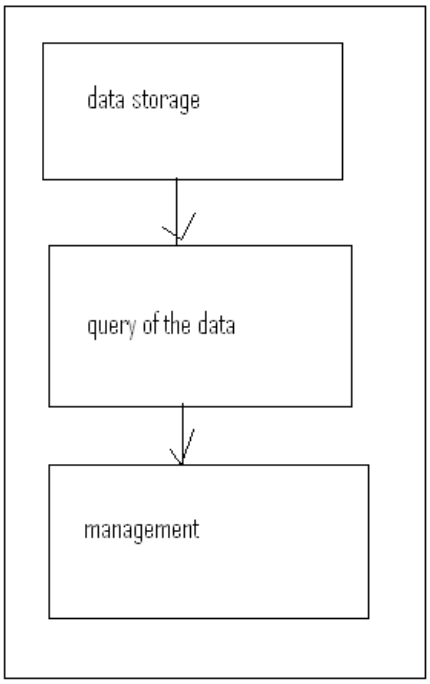

Fig 2: Shows the design architecture of the present method respectively

2. METHODOLOGY

In this paper a method is designed with a well efficient framework oriented strategy in which there is an accurate analysis of the outcome oriented strategy followed by the performance based aspect in a well oriented aspect respectively [8]. There is a huge challenge for the present method in which it is supposed to accurately analyze the problems of the several previous methods where it is supposed to accurately analyze the problems in a well efficient manner and control the degraded performance of the system by which there is an entire improvement in the system based aspect respectively [6][7]. Here the implementation of the present method is shown in the below figure in the form of the block diagram and is explained in an elaborative fashion respectively [9].

3. EXPECTED RESULTS

There is a huge challenge for the present method where it is supposed to improve the performance of the system followed by the overall system based analysis with respect to the outcome of the entire system respectively. A lot of analysis is made on the present method and the huge number of the simulations has been conducted on the large number of the data sets in a well oriented fashion respectively. A comparative analysis is made between the present method to that of the several previous methods is shown in the below figure in the form of the graphical representation and explains in a brief elaborative fashion respectively.

4. CONCLUSION

In this paper a method is designed with a well effective framework oriented strategy in which there is an accurate analysis of the performance based strategy followed by the entire system based

outcome in a well oriented fashion respectively. Here a new technique is proposed by the help of the architecture oriented with the fade based strategy in a well oriented fashion respectively. Where it is got implemented on the strategy of the system based on the cloud in a well oriented fashion respectively. Here storage plays a major role for the effective implementation of the system in a well respective fashion. Where there is a complete assurance in the system based strategy in which in which the complete entire deletion of the file takes place and plays a major role for the effective implementation of the system in a well oriented fashion respectively. Here the services based on the storage of the cloud in a well oriented fashion respectively. Here a technique is designed based on the implementation strategy of the deletion of the files based on the assured phenomena in a well oriented fashion respectively. Based on the assurance of the user based strategy there is a completely deletion of the data in a well oriented aspect takes place in the system based aspect respectively. Here we finally conclude that the present method is effective and efficient in terms of the analysis followed by the performance based strategy respectively.
